FORENSIC CONCLUSION

This forensic investigation was conducted using the USB Forensics Analyzer automated evidence collection framework. The system collected and analyzed Windows USB-related artifacts including Registry information, mounted device records, and Windows Event Log entries. Collected artifacts were correlated to identify possible relationships between detected USB devices and mounted storage volumes. SHA-256 hashing was applied to collected evidence records to support integrity verification and demonstrate that evidence records can be validated after acquisition. The findings contained in this report represent the results of automated artifact collection and correlation performed during this investigation.
