FORENSIC CONCLUSION

This investigation was performed using the USB Forensics Analyzer automated evidence collection framework. The system collected Windows USB-related artifacts from registry locations, mounted device records, and Windows Event Logs. Registry timestamps, mounted device timestamps, and event log timestamps were combined to reconstruct a chronological timeline of USB device activity. SHA-256 hashing was applied to collected artifacts to support evidence integrity verification. The findings represent the results of automated forensic artifact collection and correlation performed during this investigation.
